

The Correct Workflow

1. Deploy package (once)
1. Create allowlist (get allowlist ID)
1. Add users to allowlist (optional at this stage)
2. move
3. Apply to allowlist.mo...
4. `add_users_entry(allowlist, cap, [user1, user2, ...])`
1. Generate document ID (using allowlist ID)
1. Encrypt document (using document ID)
1. Upload to Walrus (get blob id)
1. Register blob and set permissions
2. move
3. Apply to allowlist.mo...
4. `add_users and publish_entry(allowlist, cap, [user1, user2, ...], blob id)`

The blob_id in this function is indeed the Walrus blob ID that you get AFTER uploading the encrypted document.
